LEDs

Use JP3 and JP4 to select LED voltage. If you select 5V and use a 3.3V microcontroller, make sure it can handle the voltage!

Choose R6-R9 values to match the LEDs forward voltage (Vf), choosen current (If) and supply voltage.

Use a LED tester or constant current supply to find good uniform brightness for all four LEDs and. You can use the tables on the right side to find a matching resistor value.
